Re: Revision of Part 15 of the Commission's Rules Regarding  
Ultra-Wideband Transmission Systems  
ET Docket No. 98-153  
*Ex Parte* Communication

Dear Ms. Salas:

I am writing on behalf of Mercedes-Benz USA, LLC, ("MBUSA") and its parent company, DaimlerChrysler AG, to notify you of a series of *ex parte* meetings that occurred on Tuesday, July 31, 2001, concerning issues related to the above-referenced proceeding. A copy of the handout distributed at the meetings is attached hereto.

The meetings were held to address the use of 24 GHz ultra-wideband ("UWB") radar systems to enhance automotive safety. New advances will permit automobile manufacturers to provide radar systems that will greatly reduce the incidence and severity of accidents, saving lives on America's highways. This technology will use spectrum that is far removed from spectrum below 3 GHz. Accordingly, the 24 GHz UWB systems will not pose an interference threat to GPS or other users of that spectrum. Indeed, in the voluminous record of this proceeding, no commenters have pointed to any examples of how UWB at 24 GHz could cause harmful interference to other spectrum users.

Mercedes-Benz has been incorporating "TeleAid" automobile safety telematics systems into their Mercedes-Benz vehicles since 1999. Today there are over 300,000 Mercedes-Benz vehicles on the road with TeleAid capability. This capability allows MBUSA's TeleAid Centers to be notified when an accident occurs, immediately contact the victims and (using GPS-based location information) send immediate help to the scene of the accident.

Page 2

The automotive safety applications we hope to provide using 24 GHz UWB radar technology will greatly expand upon what we currently provide today, taking us to the next level in terms of automobile safety. These devices will provide the bridge between active and passive safety systems. Mercedes-Benz is developing integrated active safety systems, passive safety systems (collision mitigation) and post-collision rescue systems that will assist in preventing accidents, minimizing their effect, and assisting emergency personnel in their response to accidents.

24 GHz is the preferred frequency band for short-range radar applications. Technology at this frequency range has a more than 20-year history, and, as a result, off-the-shelf components are widely available. This means that the development life-cycle of the product can be shortened and the technology can be provided at lower cost to consumers. In the end, however, consumers will only be able to benefit from a reasonably priced device if the device can be operated on an unlicensed basis. Requiring individual licenses for each user of the 250,000 radar systems MBUSA expects to sell annually would be impractical and cost prohibitive without providing any benefits.

Those participating in the meetings at the FCC were FCC Commissioner Gloria Tristani; FCC Commissioner Kathleen Q. Abernathy; FCC Commissioner Kevin J. Martin; Adam Krinsky, Senior Legal Advisor to Commissioner Tristani; Kyle Dixon, Legal Advisor to Chairman Powell; Bryan Traymont, Senior Legal Advisor to Commissioner Abernathy; Samuel Feder and Monica Desai of Commissioner Martin's office; Lauren Van Wazer, Legal Advisor to Commissioner Copps; Bruce Franca, Chief of the Office of Engineering and Technology ("OET"), Julius Knapp, Deputy Chief of OET; Karen Rackley, John Reed, and Ronald Chase of OET; Jason Goldman, Legal Intern in the Office of Chairman Powell; Kathy Hilke, Legal Intern in the Office of Commissioner Abernathy; Dr. Gerhard Rollmann and Dr. Volker Schmid of DaimlerChrysler AG; Jake Jones of DaimlerChrysler Corporation; William Kurtz and Daniel Selke of MBUSA; and Ari Fitzgerald, David Martin and David McGraw of Hogan & Hartson L.L.P., counsel to MBUSA.

Respectfully submitted,

Ari Q. Fitzgerald  
Counsel for MBUSA

**Ultra wide band  
24 GHz Radar Sensors  
for  
Automotive  
Applications**

Mercedes-Benz Passenger Car Development

30-Jul-01 slide 7/16

***Technical implementation***

**Technical realization approach**

**Radar Sensors ( at 24.125 GHz) are distributed all around the vehicle, mounted invisibly behind the bumper**

-Front bumper

**Radar technology at 24.125 GHz fulfills criteria for ISM-systems in the main lobe with peak power limited to 100mW**

**The envisioned systems will consist of low power devices, with radiation designed to detect objects up to 30m away**

**Low power and 6° elevation minimize potential interference**

**Ultra wide band  
24 GHz Radar Sensors  
for  
Automotive  
Applications**

Mercedes-Benz Passenger Car Development

30-Jul-01 slide 8/16

*Technical implementation*

Choice of 24 GHz frequency  
for short range applications

**24 GHz**

- ✓ Integration of moderately sized antennas  
into vehicle bumper is feasible
- ✓ Acceptable attenuation of  $\mu$ Wave propagation  
through bumper material
- ✓ Availability of off-the-shelf components,  
mature production processes

*Technical implementation*  
**Basic functionality**

$(x,y)$  and  $v_{rel}$  measured by radar

**Short radar pulses measure radial distance and velocity  
of objects relative to own vehicle**

**Combining the measurements of multiple sensors allows  
determination of object position  $(x,y)$  and speed**

- **Precise measurements require short pulse lengths**
- **Short pulse lengths in turn lead to wide bandwidths**

**Ultra wide band  
24 GHz Radar Sensors  
for  
Automotive  
Applications**

Mercedes-Benz Passenger Car Development

30-Jul-01 slide 14/16

*Potential benefits*

... for public traffic safety

sensing of the vehicle's surroundings can provide the driver with a "virtual eye"

semi-autonomous vehicle control may shorten braking distances

additional time for preparation of safety systems (PreSafe™) [e.g. Out-of-position issue]

➔ lower probability of crashes caused by cars with sensors

➔ enhanced mitigation of collision effects

• This radar system reacts 0.5 seconds faster than a human driver thus allowing 10 meters more braking distance in city traffic

➔ 60% of rear-end collisions could be avoided
